Research background

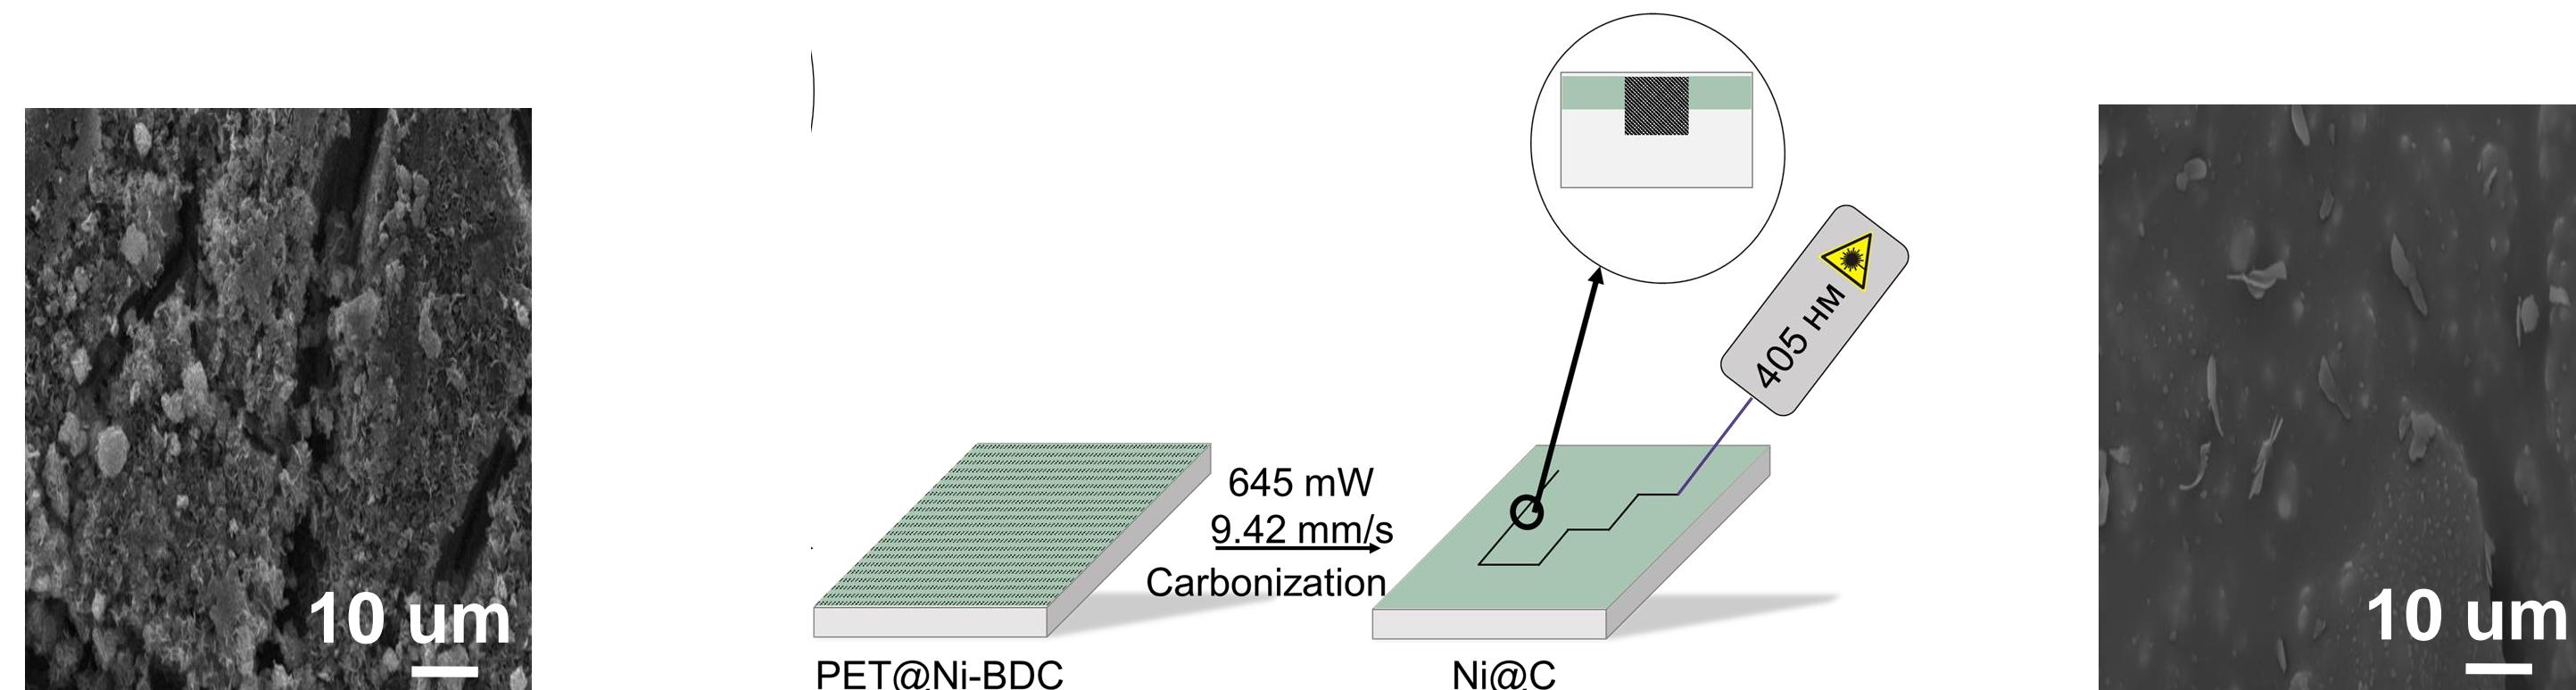

Postnikov et al. *J. Mat. Chem. A.*, 2023, 11, 1108–1115

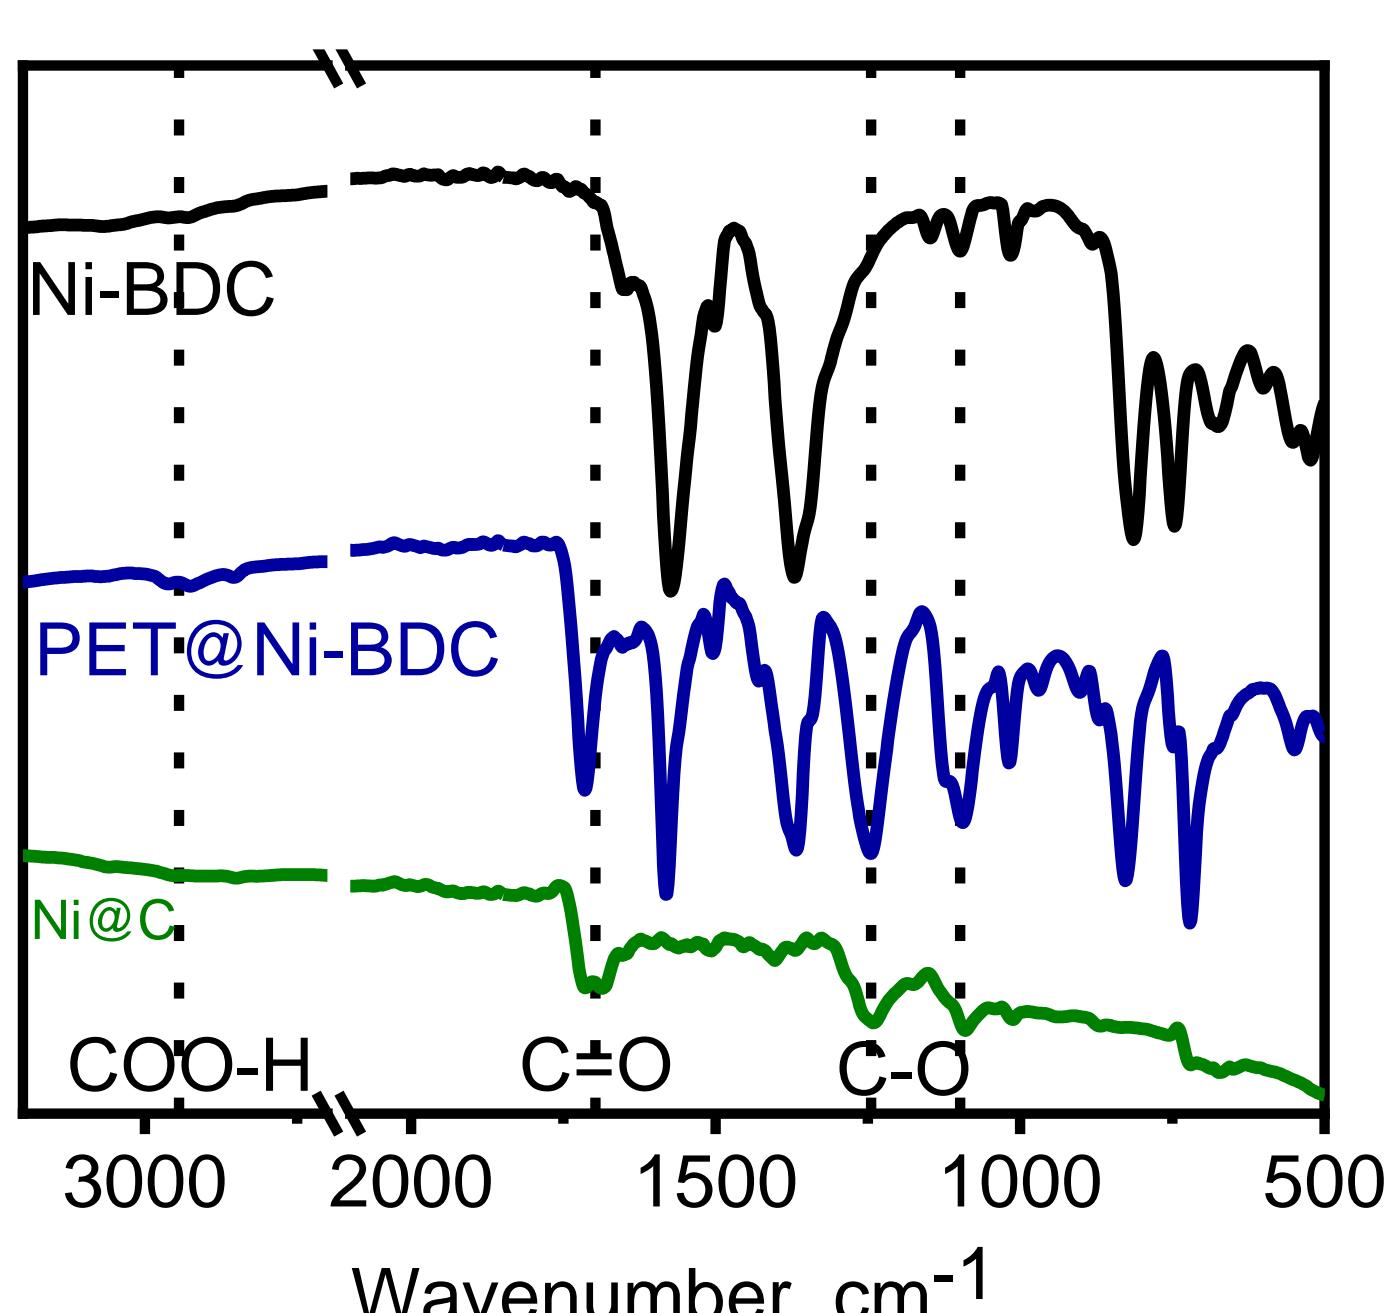

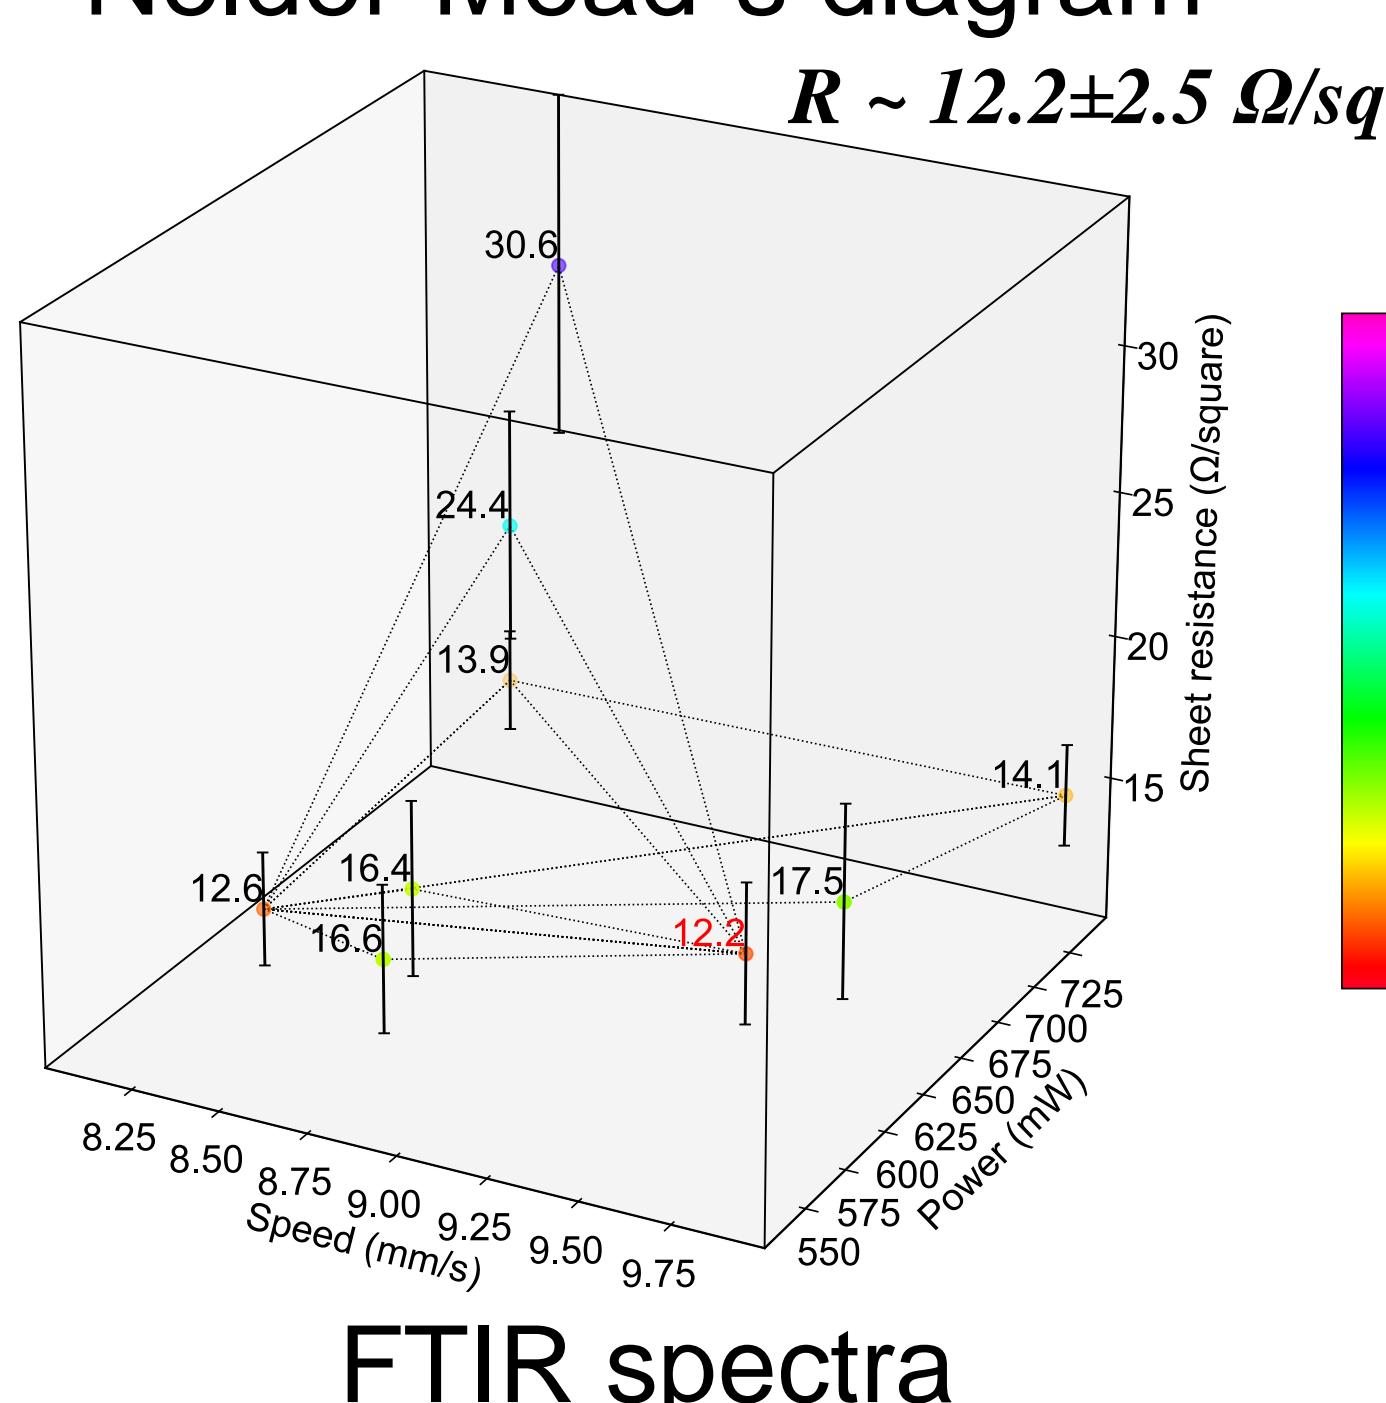

Aim of project: the development of novel approaches towards preparation the conductive materials *via* laser-assisted transformations of the metal-organic framework (MOF) Ni-BDC on the surface of waste polyethylene terephthalate (PET) for energy application

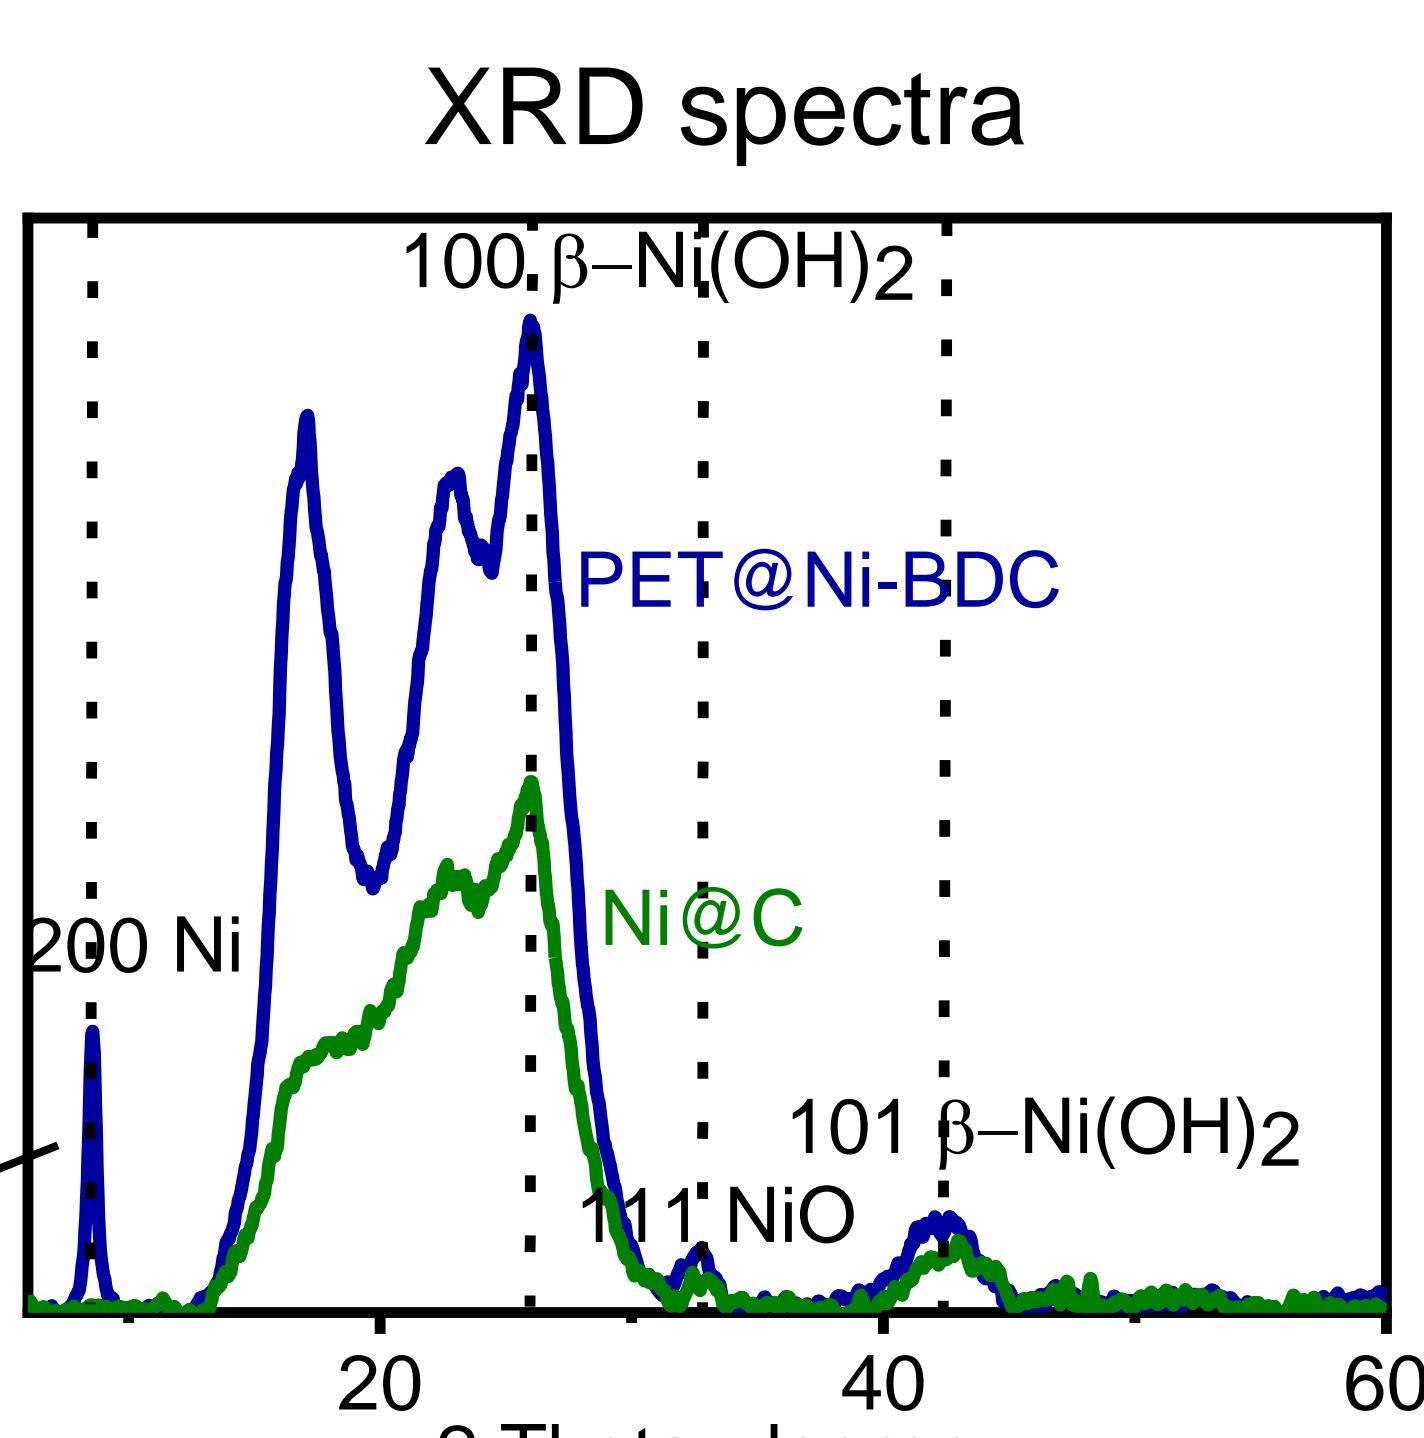

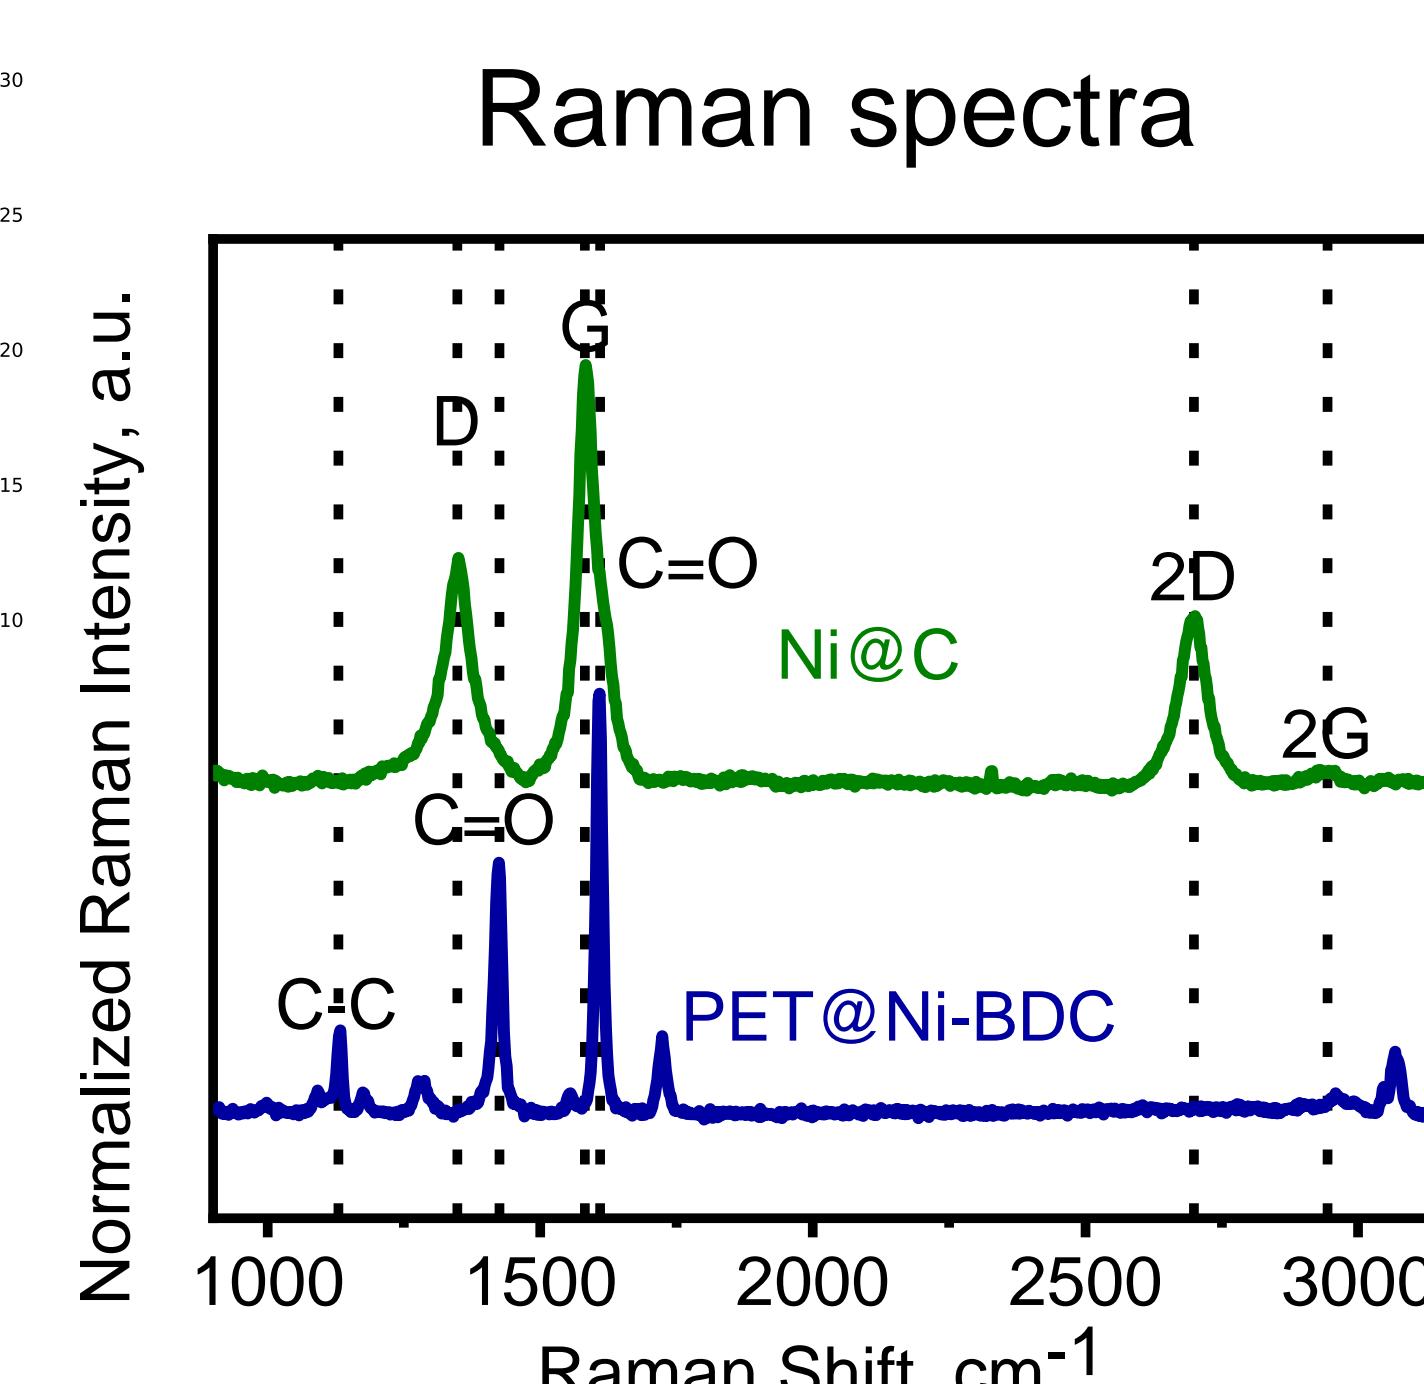

Characterization

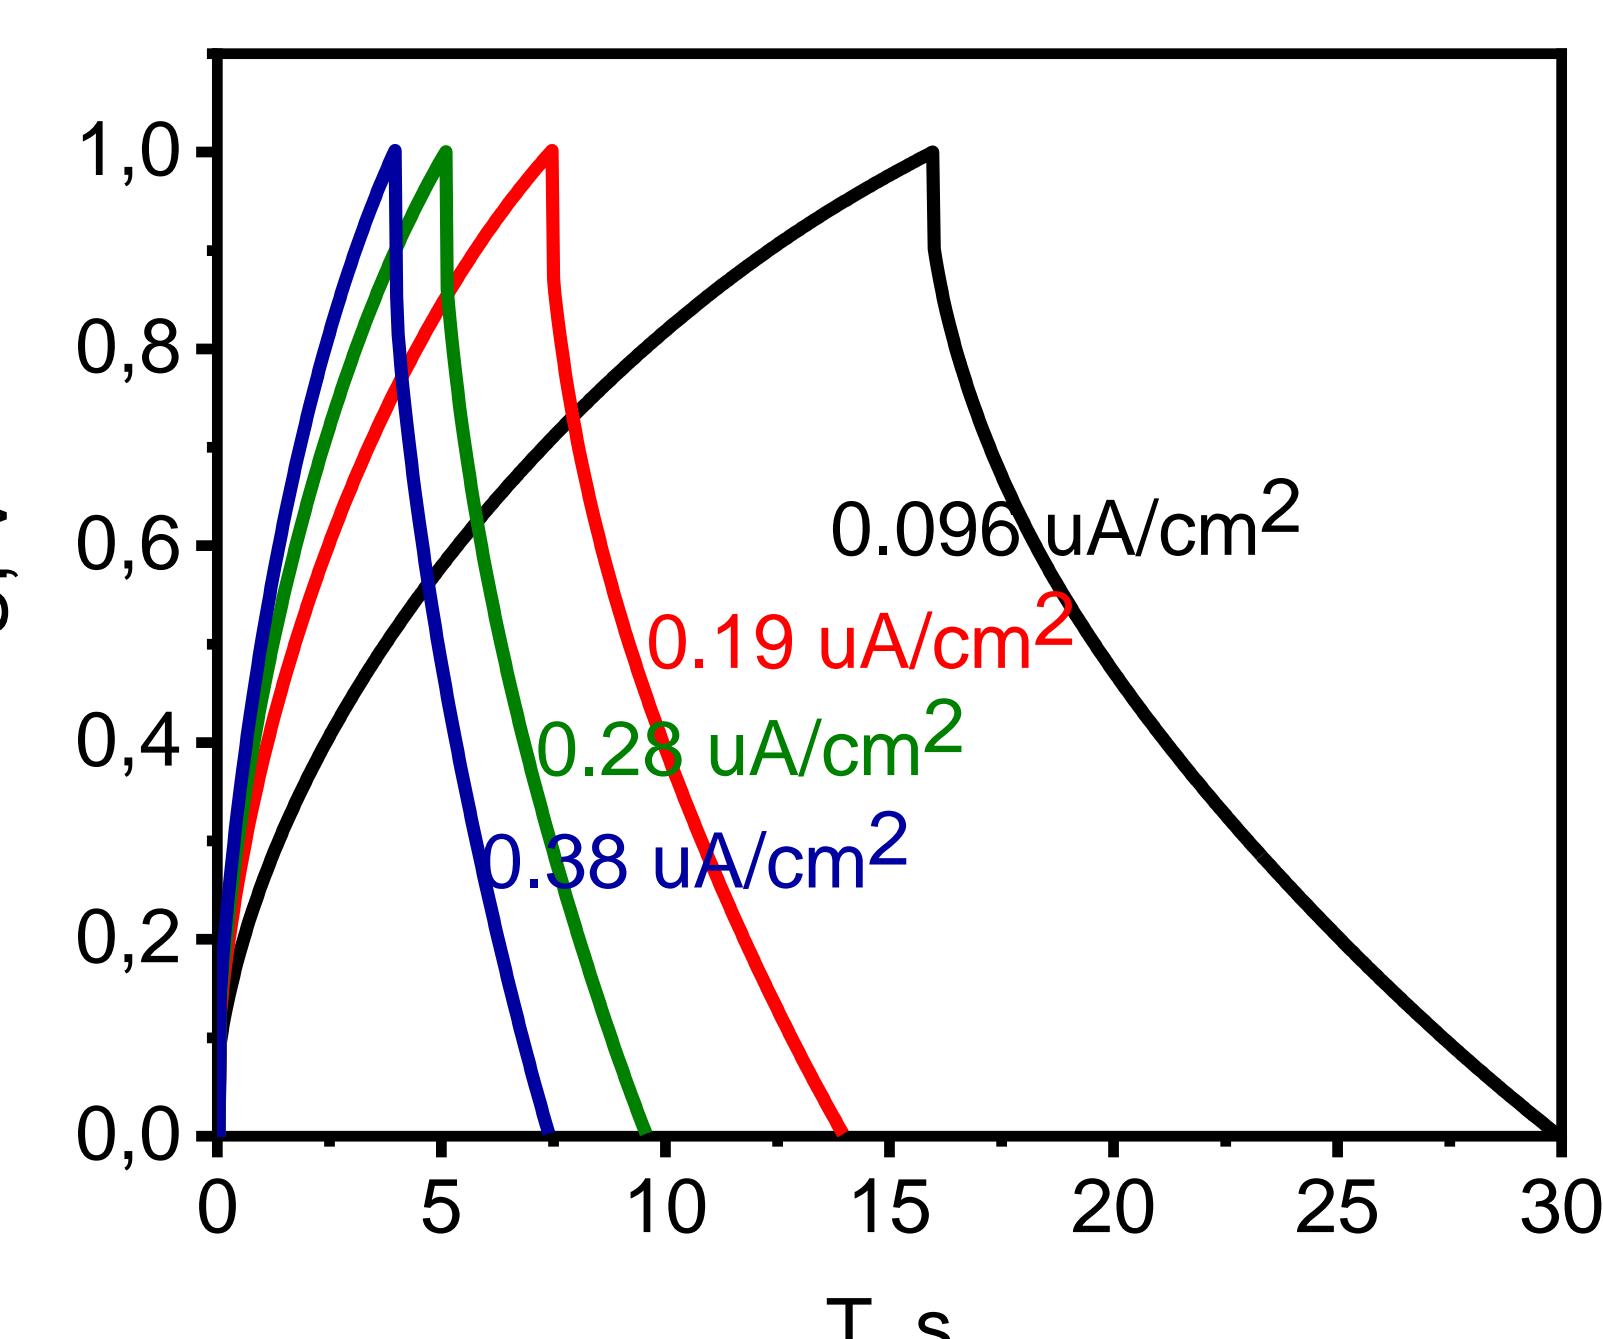

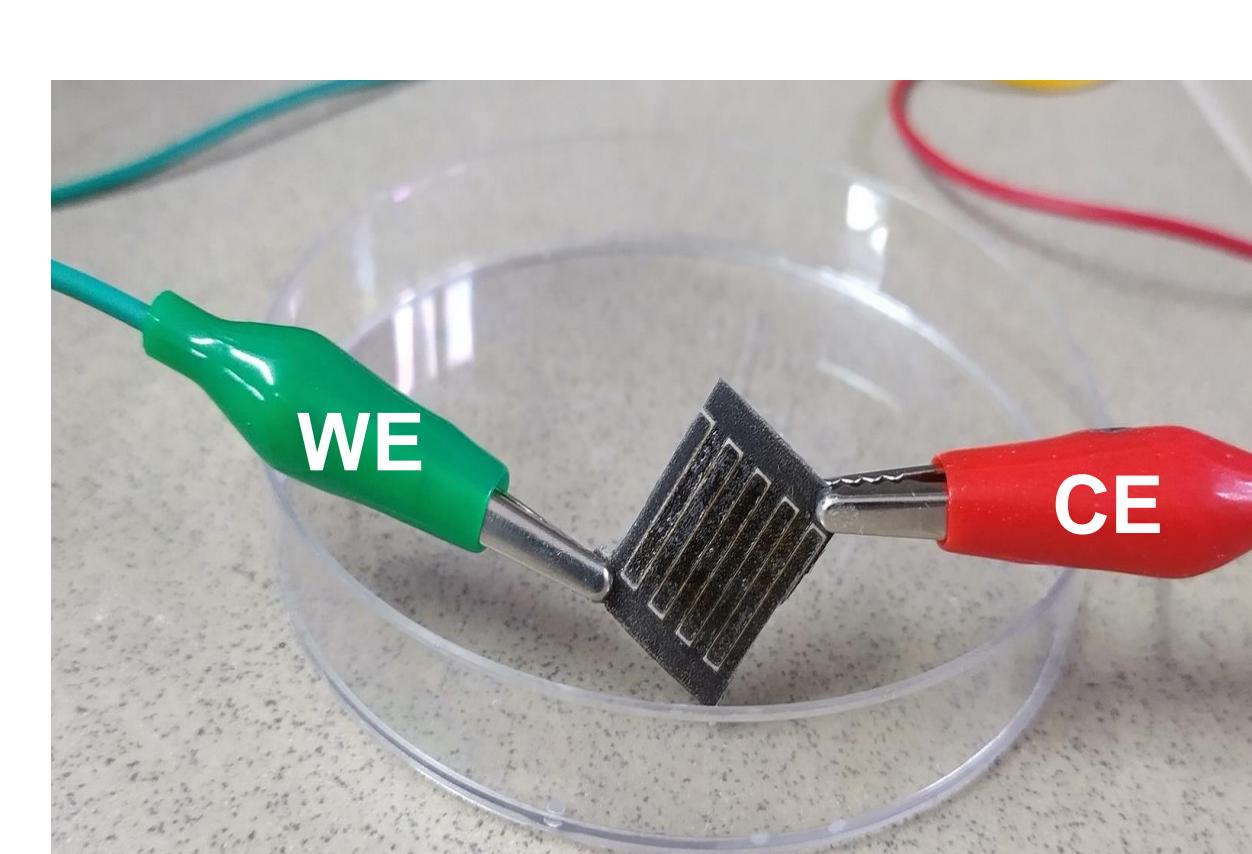

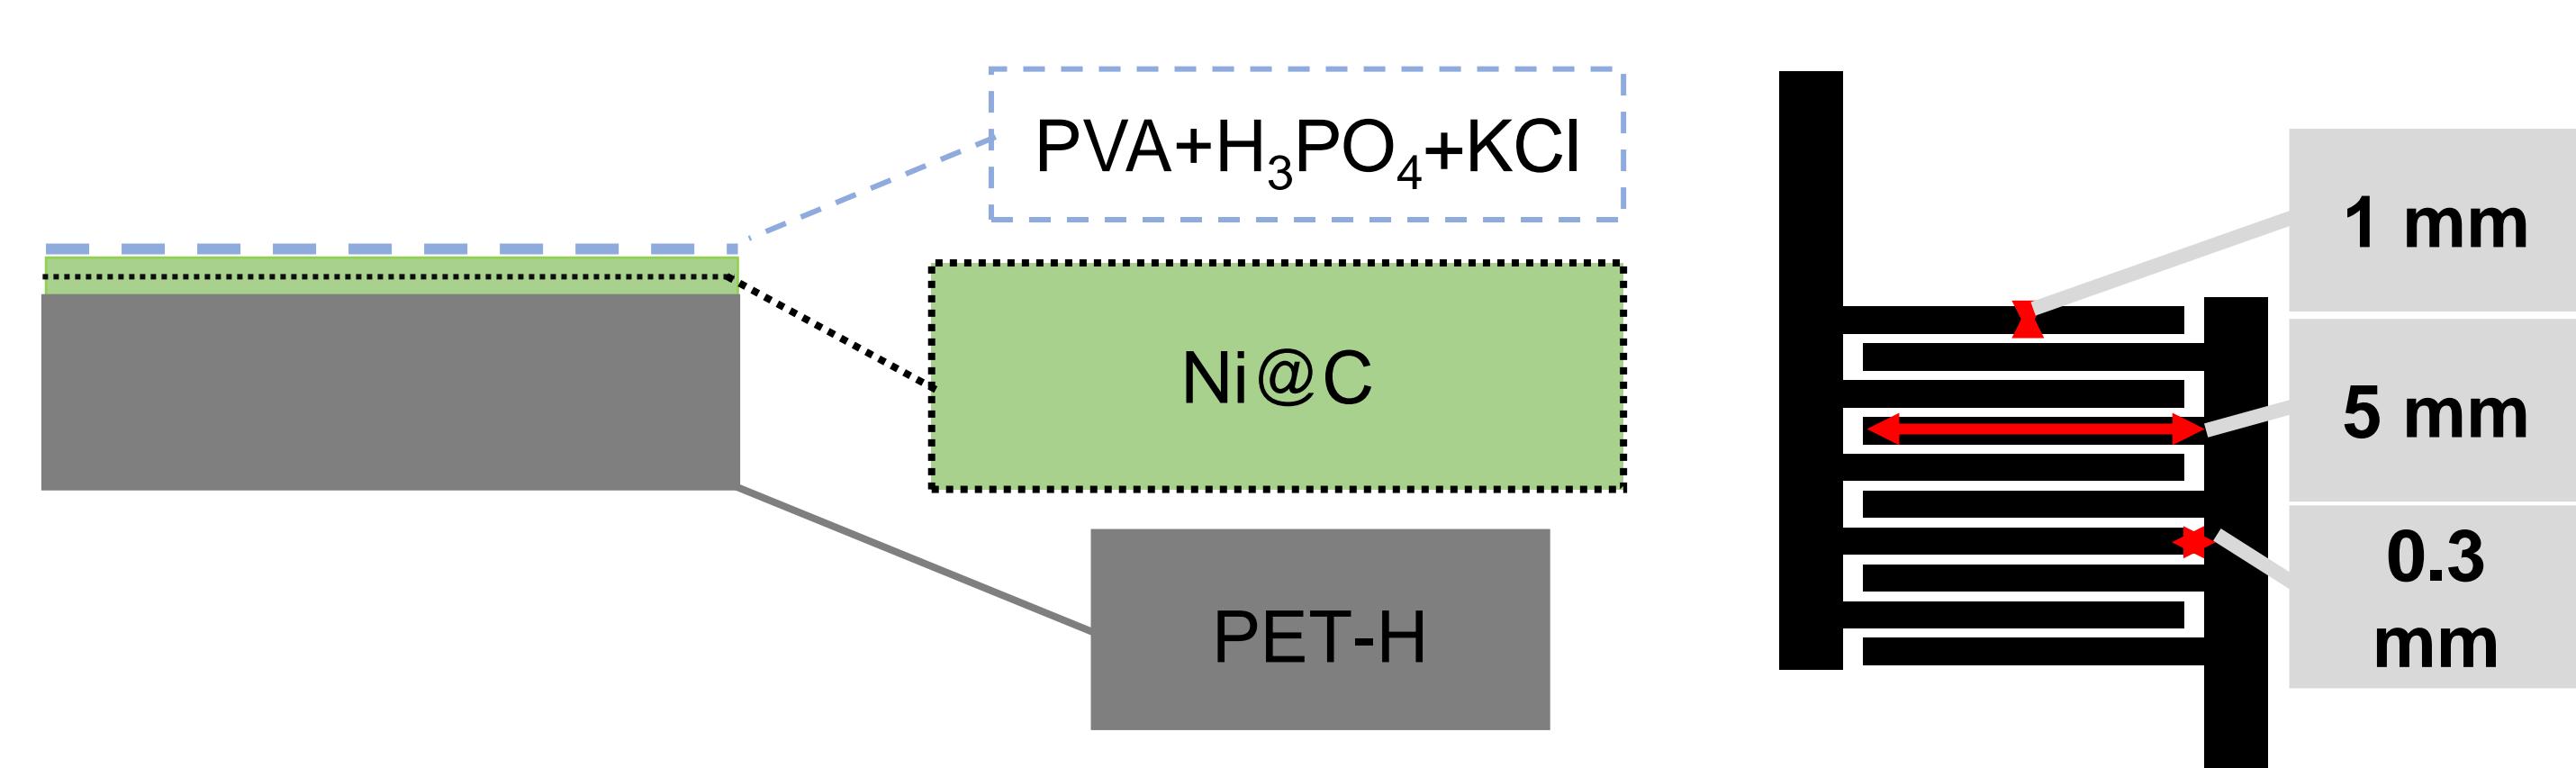

Nelder-Mead's diagram

After carbonization the peak Ni from Ni-BDC disappeared

Testing in real conditions

Conclusion: the laser-assisted carbonization of waste-PET derived Ni-BDC on the surface of PET wafers led to the formation of robust conductive surface layer demonstrating the high capacitance for the application in supercapacitor design

Specific capacitance Ni@C by GCD-method	
j, uA/cm²	C, uF/g
0.096	997.8
0.19	931.1
0.28	956.7
0.38	986.7
